BASE ADDENDUM, VERSION 1.0, OCTOBER 2026

KharYsma Coins on Base

This document describes the extension of KHACN to the Base network.
It complements the token's original whitepaper.

1. Summary

KHACN is the utility token of the KharYsma art ecosystem, launched on Ethereum on 30 January 2025. A 1:1 bridge extends it to Base. Total supply stays 10,000,000: every KHACN on Base matches one KHACN locked on Ethereum, and anyone can check this on-chain. KHACN on Base is bought on Base: bridge deposits are reserved to project wallets.

2. Ecosystem

KHACN comes from the creative world of international artist KharYsma Arafat NZABA: music, paintings and books. It is developed by Groupe Business Thérapie and operated from startarcoins.com.

3. The token

Name and symbol	KharYsma Coins, KHACN
Total supply	10,000,000 across all networks
Decimals	18
Ethereum contract	`0x11c1b94294A7967092F747434dEE4876EcA5fD53`
Base contract	published on launch day on the official page

4. The bridge

- **Ethereum to Base:** reserved to project wallets listed in the contract. KHACN is locked in the bridge, then the same amount is created on Base. Holding KHACN on Ethereum gives no access to KHACN on Base, and this rule applies to everyone.

- **Base to Ethereum:** open to any holder, 100 KHACN minimum. The fee is paid in ETH: about 1% of the price, at least 0.0002 ETH to cover the exit transaction, with a limit set in the contract. The rate follows the market price. All the KHACN are destroyed on Base then released on Ethereum.
- **Attestations:** every transfer needs signatures from 2 of 3 attesters.
- **Caps:** one limit per 24 hours and one limit on the total in circulation. They start low and are raised in steps.
- **Control:** sensitive settings and the emergency pause go through a multisignature vault (Safe). This vault can block an address tied to a theft inside the bridge. The token itself has no blacklist and no freeze.

The KHACN contract on Base is immutable and has no owner. The reserve page compares the locked stock and the circulating amount live.

5. Launch on Base

1. **Public Uniswap auction** of about 3 days, $0.20 floor. All winners pay the same final price.
2. **Uniswap V4 pool** created at the price set by the auction. Initial liquidity is locked for 182 days.
3. **Sell ladder:** KHACN offered in steps above the price, to meet strong demand without abrupt selling.
4. **Additional pools** on Aero and DODO, and liquidity rewards through Merkl.
5. **Happy Hours:** discounted sales, capped and announced in advance.

6. Launch allocation

Item	KHACN	%
Sell ladder	150,000	50.0
Bridge reserve, not offered at launch	78,700	26.2
Public auction	26,000	8.7
Liquidity rewards (Merkl)	20,000	6.7
Locked initial pool	14,000	4.7
Happy Hours	6,300	2.1
Community airdrop	5,000	1.7

Total	**300,000**	**100**

These amounts come from the owner's existing stock on Ethereum: no additional KHACN is created. The owner's reserve of 3,704,743 KHACN stays on Ethereum, outside this table. It moves to Base only if the project decides so, within the 10,000,000 limit.

7. Market and principles

The project does not organise fake volume, trades against itself or misleading messages. The ladder and the Happy Hours are sales by the project: the proceeds fund the treasury and liquidity. Pools earn the usual trading fees of the protocols used.

8. Security

- Contracts published and verified on explorers; test version deployed on Sepolia and Base Sepolia.
- 131 automated tests and Slither static analysis.
- De.Fi, Skynet CertiK and VirusTotal reports available for the Ethereum token.
- Internal bridge review in October 2026: what backs Base can no longer be taken out by the emergency function.
- **Known limits:** to date, the bridge has not had a paid external audit, and its code remains upgradeable by the multisignature vault. The low starting caps are there to contain this risk.

9. Roadmap

1. Ethereum–Base bridge, public auction and Uniswap pool.
2. Wider liquidity on Base and liquidity rewards.
3. Multichain listings and gradual raising of the bridge caps.

These steps depend on adoption and have no guaranteed date.

10. Risks

- **Market:** the price can fall sharply, up to a total loss.
- **Liquidity:** selling can be difficult, especially at the start.
- **Technical:** a contract, a bridge or a third-party protocol can contain a flaw.
- **Operational:** attesters being unavailable or a key being compromised.

- **Regulatory:** rules vary by country and can change.

11. Disclaimer

This document is for information only. It is neither an offer of securities, nor investment advice, nor a promise of gain or value. Unless an official document says otherwise, KHACN grants no company share, dividend or redemption right. Everyone must check the rules that apply in their own country.
